

Changing the way applications are delivered to the Education sector

Droplet Computing's patent-pending container technology enables fully featured applications to run on your Smartphone, iPad, Chromebook, Apple Mac, Windows PC or any other device with sufficient resources and a modern browser – even if the operating system on your device does not normally support those applications. Once delivered the container has the ability run either on-line or off-line, delivering a semi-connected solution.

Your applications then run securely within the Droplet Computing Container and are delivered directly to the browser rather than the device, enabling the container to run independently of the device's underlying operating system, and even its chipset, which provides you with the freedom of device choice.

How can Droplet Computing Help Education Users?

Droplet Computing is all about providing flexibility to the end user and, most importantly for the Education sector, delivering a solution that is scalable but remains within a tight budget. Droplet Computing can achieve this in two important ways:

Hardware – Droplet Computing can be delivered to any device with a browser. A Chromebook can be turned into a PC by deploying the container. You can buy four Chromebooks for the price of a single laptop.

Applications – Droplet Computing delivers applications to any device, reducing the cost of desktop management and increasing access to education resources in a secure and configurable format.

Enabling

By deploying Droplet computing, a school, college or university will be able to build a clear picture of which applications are needed and identify those that are surplus to requirements. Droplet computing enables the repurposing of old hardware, breathes new life into thick client software and reduces the risk posed by running applications on unsupported operating systems.

The Future

The Droplet Computing Universal Container enables IT Departments to take their existing applications and place them into an environment that is decoupled from the OS, thus making the apps portable, delivering the applications your students and staff need securely to any device. Droplet computing can even facilitate offline working for an area with poor connectivity. The students and staff will then be able to access whatever they need from wherever they are.

Legacy Applications

With Droplet computing's semi-connected container technology, you are no longer limited by the device, or by only being able to work when connected.

Applications can simply be installed directly into the Droplet Universal Container unchanged, or by using the application delivery mechanism you use currently. There is no need to refactor, package, or virtualise the applications to make them work. If, however, you already deliver them in that way, Droplet Computing will allow you to extend the ability to run these applications on whatever device you choose to use.

Mobility

Removing the requirement to be tied down to an Operating System on the device removes the requirement to be tied to that device. Droplet computing enables you to have your applications on the device of your choice, through a browser, both online and offline.

Minimum Requirements to run Droplet Containers

Browser Requirements	Device Requirements
Chrome v60 Firefox v52 Android v62 Safari v11 Edge v16 iOS v11.1	Droplet Containers run on x86 and ARM devices running one of the supported browsers and enough resources to support the applications.
