

Changing the way applications are delivered to the Finance sector

Droplet Computing's patent-pending universal container technology enables fully featured applications to run on your Smartphone, iPad, Chromebook, Apple Mac, Windows PC or any other device with sufficient resources and a modern browser – even if the operating system on your device does not normally support those applications. Once delivered the container has the ability run either online or offline, delivering a semi-connected solution.

Your applications then run securely within the Droplet Universal Container, and are delivered directly to the browser rather than the device, enabling the container to run independently of the device's underlying operating system, and even its chipset, which provides you with the freedom of device choice.

The Challenge for Finance Companies

Many mission-critical applications written to support business operations are being rewritten to be Cloud native, but many more remain firmly chained to desktop operating systems. The challenge for Finance Companies is ensuring these applications continue to work as security patches are applied. Even after migrating to Windows 10, all applications require testing every six months as updates are rolled out.

What does that mean?

Finance companies often face an impossible choice – to update their operating systems to maintain the highest levels of security in the face of increased data protection regulation, potentially breaking application dependencies; or, to 'lock down' environments, applying costly security layers to prevent ever present threats to prevent applications failing.

How does Droplet Computing help?

Droplet Computing provides a solution in the form of a secure container which decouples the application and its runtimes away from the underlying operating system.

Once installed in a Droplet Universal Container, applications become 'Evergreen'. This means that the application is not impacted by patches or updates applied to the device's operating system and ensures the application functions as intended with no modification, and better yet, without the need for a remote desktop instance.

Legacy Applications

With Droplet Computing's semi-connected container technology, you are no longer limited by the device, or by only being able to work when connected.

Applications can simply be installed directly into the Droplet Universal Container unchanged, or by using the application delivery mechanism you use currently. There is no need to refactor, package, or virtualise the applications to make them work. If, however, you already deliver them in that way, Droplet Computing will allow you to extend the ability to run these applications on whatever device you choose to use.

Mobility

Removing the requirement to be tied down to an operating system on the device removes the requirement to be tied to that device. Droplet Computing enables you to have your applications on the device of your choice, through a browser, both online and offline.

Minimum Requirements to run Droplet Universal Containers

Browser Requirements	Device Requirements
Chrome v60 Firefox v52 Android v62 Safari v11 Edge v16 iOS v11.1	Droplet Containers run on x86 and ARM devices running one of the supported browsers and enough resources to support the applications
