

# Changing the way applications are delivered to Government departments

**Droplet Computing's patent-pending container technology enables fully featured applications to run on your Smartphone, iPad, Chromebook, Apple Mac, Windows PC or any other device with sufficient resources and a modern browser – even if the operating system on your device does not normally support those applications. Once delivered the container has the ability run either on-line or off-line, delivering a semi-connected solution.**

Your applications then run securely within the Droplet Computing Container and are delivered directly to the browser rather than the device, enabling the container to run independently of the device's underlying operating system, and even its chipset, which provides you with the freedom of device choice.

More importantly, the device itself is not modified in any way and neither are the applications that you choose to run on it. The applications are the same applications that you would use on any other device. For example, running the full Windows version of Microsoft Office on an iPad.

## The Challenge in Local and Central Government

How many applications are being maintained in the Public Sector and how many are actually being used?

### What does this mean?

In relation to IT strategy, one of the most salient questions is "How does Central Government review the number of applications that are currently supported versus how many are needed?"

Droplet computing can deliver a strategy that will instantly reduce the cost of delivering applications to Central Governmentend users.

## How does Droplet Computing achieve this?

The Droplet Computing Universal Container enables IT Departments in Central Government to take their existing applications and place them into an environment that is decoupled from the OS, thus making the apps portable. This means that the OS will no longer affect the running of the application which also means there is no more need for expensive extended support for XP and WIN 7 Apps.

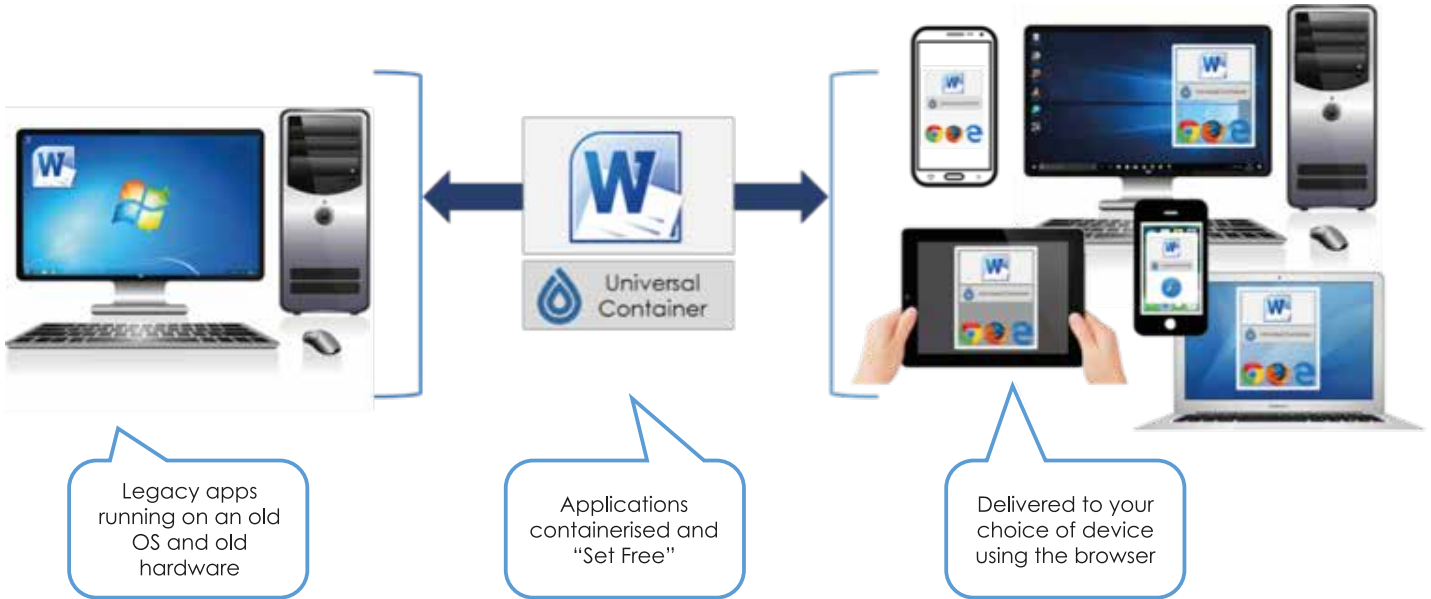

The Droplet computing container can then deliver those applications to ANY DEVICE via a browser. Droplet can even facilitate offline working for an area with poor connectivity.

## The Result

Clear savings agenda for both hardware and software.

## Legacy Applications

With Droplet computing's semi-connected container technology, you are no longer limited by the device, or by only being able to work when connected.

Applications can simply be installed directly into the Droplet Universal Container unchanged, or by using the application delivery mechanism you use currently. There is no need to refactor, package, or virtualise the applications to make them work. If, however, you already deliver them in that way, Droplet Computing will allow you to extend the ability to run these applications on whatever device you choose to use.

## Mobility

Removing the requirement to be tied down to an Operating System on the device removes the requirement to be tied to that device. Droplet computing enables you to have your applications on the device of your choice, through a browser, both online and offline.

## Minimum Requirements to run Droplet Containers

Browser Requirements	Device Requirements
Chrome v60 Firefox v52 Android v62 Safari v11 Edge v16 iOS v11.1	Droplet Containers run on x86 and ARM devices running one of the supported browsers and enough resources to support the applications.

## More Information
